

What is frogflowC™?

frogflowC™ is a drain line maintenance product designed to clean and deodorize plumbing systems for commercial use.

How does frogflowC™ work?

frogflowC™ is formulated with highly sensitive strains of Live Vegetative Bacteria as well as a powerful Odor Counteractant. When frogflowC™ is introduced into a commercial drain line system via battery operated pump, the active bacteria go to work by consuming the organic matter in the drain that is problematic to the system. The end result of using frogflowC™ is a drain line system which is free of blockage causing build up and offensive odors!

What types of drain line problems will frogflowC™ work on?

- Grease and Grease Traps
- Soaps
- Starches
- Organic Matter
- Hair
- Odors

Is frogflowC™ right for me?

A drain line system should have "good" bacteria residing in it. The naturally occurring bacteria exist to help break down organic matter in the drain line such as fats, oils, grease, sugars, starches and soaps. Drain lines need these good bacteria to function properly. Using frogflowC™ for preventative drain line maintenance will add and also replace the missing good bacteria to the drain line system which will assure that it functions properly.

How does frogflowC™ help in controlling drain line odors?

frogflowC™ eliminates odors from drain lines by source reduction and odor counteraction. Generally the source of odors in commercial drain line systems comes from the decay of organic matter which build up in drains and pipework. frogflowC™ works by degrading and reducing this matter, therefore eliminating the odor by removing the source! frogflowC™ also contains powerful odor counteractant which works to eliminate drain odors rather than just temporarily covering them up.

Questions?

bluefrog Plumbing + Drain's considerate, professional service experts are highly trained and knowledgeable. We'd love to answer any of your questions or evaluate your plumbing situation at no cost!
